

**Control your  
dependencies  
don't let them control you**

**Brandon Williams**

@pointfreeco (@hachyderm.io)

**What is a  
dependency?**

# What is a dependency?

The types and functions in your application that need to interact with outside systems that you do not control.

*Examples of dependencies*

## Network API clients

```
let users = try await apiClient.fetchUsers()
```

*Examples of dependencies*

# Location managers

```
let manager = CLLocationManager()  
  
await manager.requestWhenInUseAuthorization()  
  
let location = try await manager.requestLocation()
```

*Examples of dependencies*

# File systems

```
var data = try Date(contentsOf: URL(...))
```

```
data.append(...)
```

```
try data.write(to: URL(...))
```

## *Examples of dependencies*

# Firestore

```
import FirebaseDatabase

let ref = Database.database().reference()
self.ref
    .child("users")
    .child(user.uid)
    .setValue(["username": username])
```

*Examples of dependencies*

# Clocks and schedulers

```
try await Task.sleep(for: .seconds(1))
```

```
DispatchQueue.main.schedule(after: .now + 1)  
{  
    ...  
}
```

## *Examples of dependencies*

**Date ()** and **UUID ()**

```
let user = User(  
  id: UUID(),  
  name: "Blob",  
  createdAt: Date()  
)
```

*Examples of dependencies*

**...and *a lot* more**

# The problem with uncontrolled dependencies

*The problem with dependencies*

**Many are slow to compile**

```
import Firebase
```

***| Build succeeded 86.9 seconds***

*The problem with dependencies*

**Some make it annoying to run  
your code**

*The problem with dependencies*

**Some do not work in Xcode  
previews**

*The problem with dependencies*

**Some *break* Xcode previews**

*The problem with dependencies*

**Accidental interaction with  
“live” dependencies**

*The problem with dependencies*

**Difficult or impossible to unit  
test and UI test**

**Death by 1,000 paper cuts**

**What can we do about it?**

**In short:**

**Don't reach out to code you  
don't own and can't control**

# *Controlling dependencies*

## **Time**

```
let clock: any Clock<Duration>  
try await clock.sleep(for: .seconds(1))
```

*Controlling dependencies*

# Analytics

```
let analytics: any Analytics = LiveAnalytics()  
  
analytics.track("Authorization granted")
```

*Controlling dependencies*

# Apple Frameworks

**Dependencies  
controlled**

# Safety & Ergonomics

# Safety

```
init(  
    analytics: any Analytics = LiveAnalytics(),  
    location: any LocationClient = LiveLocationClient()  
) {  
    // ...  
}
```

# Ergonomics

```
init(  
    analytics: any Analytics,  
    locationClient: any LocationClient  
) {  
    // ...  
}
```

---

*Defaults are **ergonomic**, but not **safe**.  
Requirements are **safe**, but not  
**ergonomic**.*
